## Preface

This publication is one of a series of county and city tidal marsh inventories prepared by the Wetlands Advisory Group of the Virginia Institute of Marine Science. The previously published reports include:

Lancaster County	City of Virginia Beach	New Kent County
Northumberland County	Vol. 1 and 2	Essex County
Mathews County	City of Newport News	Isle of Wight County
York County and the Town of Poquoson	and Fort Eustis	Middlesex County
Stafford County	Accomack County	City of Norfolk
Prince William County	Northampton County	King William County and Town of West Point
King George County	Westmoreland County	King and Queen County
City of Hampton	James City County	Prince George County
Fairfax County	and the City of Williamsburg	and City of Hopewell
Gloucester County	Surry County	City of Portsmouth
	Spotsylvania and Caroline Counties	City of Virginia Beach Vol. 3
	and the City of Fredericksburg	

Under Section 62-1.13.4 of the Virginia Wetlands Act, the Virginia Institute of Marine Science is obligated to inventory the tidal wetlands of the Commonwealth. This inventory program is designed to aid the local wetlands boards, the state and federal regulatory agencies, and regional planning districts in making informed rational decisions on the uses of these valuable resources. They are also intended for use by the general public as a natural history guide and the scientific community as a research data source.

The reader is referred to the Shoreline Situation Report, Richmond County, SRAMSOE No. 164, Virginia Institute of Marine Science, Gloucester Point, Virginia 23062. This report focuses on various shoreline characteristics including areas of erosion and accretion, beaches, marshes, artificially stabilized areas, and fastland types and uses.

Also of interest may be a booklet, Wetlands Guidelines, available from the Marine Resources Commission, Newport News, Virginia, which describes the wetlands types and the types of shoreline activities which affect wetlands and what these effects are.

### **Acknowledgements**

I would like to thank my boat operators Bob Croonenberghs and Tom Luckham without whose tireless efforts this inventory would not have been possible. I would also like to thank the personnel of the Virginia Department of Transportation who opened the bridge at the mouth of Cat Point Creek to allow us access.

We would especially like to thank Berch Smithson and Anna K. Kenne for the digital cartography, Julie G. Bradshaw for the cover photograph, William Jenkins for the photographic reproductions, Janet Walker for tables and topography, Judy Hudgins and Gene Silberhorn for their review of the manuscript, and Dianne Bowers for her invaluable assistance.

The field work for this inventory was funded in part by the Department of Commerce, National Oceanic and Atmospheric Administration, Office of Coastal Zone Management, Grant No. 04-6-168-44037, and in part by the Virginia Council on the Environment's Coastal Resources Management Program through grant # NA89AA-D-CZ134 of the National Oceanic and Atmospheric Administration under the Coastal Zone Management Act of 1972 as amended.

## Introduction

Richmond County is blessed with an especially rich diversity of tidal wetlands. They vary from the brackish marshes of Lancaster Creek through the slightly brackish marshes near the Route 360 bridge to the tidal freshwater marshes of upper portion of the county. This is due primarily to the changes in salinity which occur along this reach of the Rappahannock River. Many of the tributary creeks also display this transition, with brackish or slightly brackish marshes at their mouths and tidal freshwater marshes at their heads.

By virtue of its location along the Rappahannock River, Richmond County is also endowed with a wide variety of other marine resources which depend in one way or another on these tidal wetlands for food, habitat or maintenance of water quality. These range from the oyster growing areas of the lower county to the anadromous fish spawning areas of the tidal freshwater portions of the river and its tributaries.

This inventory is divided into ten sections beginning at the upper end of the county. Each section relates to a specific reach of the river shoreline or creek system. It covers 223 separate marshes totalling 4724 acres. The dominant wetland type is big cordgrass (2000 acres) which is indicative of low salinity or slightly brackish conditions. The next most abundant community in the county is the arrow arum-pickerelweed community (354 acres) which is indicative of freshwater areas. The next most abundant communities are saltmarsh cordgrass (351 acres), cattails (273 acres), saltmeadow (256 acres) and saltbush (237 acres) indicating a wide range of environmental conditions from fresh to brackish water.

The largest single marsh, 823 acres, is the McGuire Creek complex (#63) just below the Route 360 bridge which is dominated by big cordgrass and a number of brackish water species. Further upstream is the largest marsh system, Cat Point Creek (#15-#45), which is composed of a combination of oxbow, creek and broad fringing marshes. It is dominated by big cordgrass and a large number of freshwater species.

Something of special interest is the occurrence of prairie cordgrass, *Spartina pectinata*, in Marsh #4. This is one of only eight places it has been reported from in the state.

## Methods

Wetland locations and wetland boundaries were obtained by consulting USGS topographic maps and aerial photographs. The configuration and areal extent of each marsh was confirmed by observations by boat, on foot or by low level overflights. Individual plant species percentages are quantitative estimates of coverage based on visual inspections of every marsh.

These percent cover estimates are subject to a seasonal bias depending on what time of the year the estimates are made. In the brackish water marshes if the observations are in the spring many of the late developing annuals, e.g. water hemp, saltmarsh aster, marsh fleabane and orach, are not visible among the earlier developing grasses. In the freshwater marshes the spring and early summer dominants are usually the perennials, e.g. arrow arum, pickerelweed and cattails. During late summer and early fall these are often replaced by beggars ticks and rice cutgrass as the dominant species in the same marsh. This inventory was conducted during June, July and August of 1978.

The outline of each marsh as depicted on the topographic map was planimetered to determine its acreage. Marshes 0.25 acres or larger are designated by number. The acreage, plant species percentage and acreage, marsh type and other observations are recorded in tabular form for each of these marshes. Marshes less than 0.25 acres (usually narrow fringing marshes and very small pocket marshes) are indicated by the same shaded symbol as the numbered marshes but are not included in the tabulations. The size of the small marshes (less than one acre) is exaggerated on the maps for clarity and is not always to scale.

Plant species percentages are recorded to the nearest percent and acreages to the nearest 0.1 acre in the larger marshes and the nearest 0.01 acre in the smaller marshes. The acreages of the smaller marshes are probably not accurate to the second decimal. This is used, however, as a means to more accurately balance the calculated acreages of the individual species. In those instances where an individual plant species was estimated to amount to less than 0.5 percent or 0.05 acre, the symbol (-) is used to indicate a trace amount. In unusual situations where an individual marsh was estimated to contain more than 50 percent or more of a species not listed as a marsh type, the closest applicable marsh type was used. For example, a marsh judged to contain 50 percent marsh hibiscus would be listed as Type XI (Freshwater Mixed).

## **Marsh Types and Evaluation**

For a better understanding of what is meant by marsh types, some background information is required. The personnel of the Wetland Advisory Group have classified twelve different, common marsh types in Virginia, based on vegetational composition. These marsh types have been evaluated according to certain values and are recorded in the Guidelines report. The following is a brief outline of the wetland types and their evaluation as found in that publication:

It is recognized that most wetlands areas, with the exception of the relatively monospecific cordgrass marshes of the Eastern Shore, are not homogeneously vegetated. Most marshes are, however, dominated by a major plant. By providing the manager with the primary values of each community type and the means of identification, he then has a useful and convenient tool for weighing the relative importance of each marsh parcel. In Virginia, many wetlands management problems involve only a few acres or a fraction of an acre. The identification of plant communities permits the manager to evaluate both complete marshes and subareas within a marsh.

Each marsh type may be evaluated in accordance with five general values. These are:

1. Production and detritus availability. Previous VIMS reports have discussed the details of marsh production and the role of detritus which results when the plant material is washed into the water column. The term "detritus" refers to plant material which decays in the aquatic system and forms the basis of a major marine food web. The term "production" refers to the amount of plant material which is produced by the various types of marsh plants. Vegetative production of the major species has been measured, and marshes have been rated in accordance with their average levels of productivity. If the production is readily available to the marine food web as detritus, a wetlands system is even more important than one of equal productivity where little detritus results. Availability of detritus is generally a function of marsh elevation and total flushing, with detritus more available to the aquatic environment in the lower, well-flushed marshes.

2. Waterfowl and wildlife utilization. Long before marshes were discovered to be detritus producers, they were known as habitats for various mammals and marsh birds and as food sources for migratory waterfowl. Some marsh types, especially mixed freshwater marshes, are more valuable because of diversity of the vegetation found there.

3. Erosion buffer. Erosion is a common coastal problem. Marshes can be eroded, but some, particularly the more saline types, are eroded much more slowly than adjacent shores which are unprotected by marsh. This buffering quality is derived from the ability of the vegetation to absorb or dissipate wave energy by establishing a dense root system which stabilizes the substrate. Generally, freshwater species are less effective than saltwater plants in this regard.

4. Water quality control. The dense growth of some marshes acts as a filter, trapping upland sediment before it reaches waterways, thus protecting shellfish beds and navigation channels from siltation. Marshes can also filter out sediments that are already in the water column. The ability of marshes to filter sediments and maintain water clarity is of particular importance to the maintenance of clam and oyster production. Excessive sedimentation can reduce the basic food supply of shellfish through reduction of the photic zone where algae grow. It can also kill shellfish by clogging their gills. Additionally, marshes can assimilate and degrade pollutants through complex chemical processes, a discussion which is beyond the scope of this paper.

5. Flood buffer. The peat substratum of some marshes acts as a giant sponge in receiving and releasing water. This characteristic is an effective buffer against coastal flooding, the effectiveness of which is a function of marsh type and size.

Research and marsh inventory work accomplished by VIMS personnel indicate that 10 species of marsh vegetation tend to dominate many marshes, the dominant plant depending on water salinity, marsh elevation, soil type, and other factors. The term "dominant" is construed to mean that at least 50% of the vegetated surface of a marsh is covered by a single species. Brackish and freshwater marshes often have no clearly dominant species of vegetation. These marshes are considered to be highly valuable in environmental terms.

**Marsh Types and Their Environmental Contributions**  
*(Edited from Guidelines for Activities Affecting Virginia Wetlands)*

Type I    **Saltmarsh Cordgrass Community**

- a. Average yield 4 tons per acre per annum. (Optimum growth up to 10 tons per acre.)
- b. Optimum availability of detritus to the marine environment.
- c. Roots and rhizomes eaten by waterfowl and stems used in muskrat lodge construction. Also serves as nesting material for various birds.
- d. Deterrent to shoreline erosion.
- e. Serves as sediment trap and assimilates flood waters.

Type II    **Saltmeadow Community**

- a. 1-3 tons per acre per annum.
- b. Food (seeds) and nesting areas for birds.
- c. Effective erosion deterrent.
- d. Assimilates flood waters.
- e. Filters sediments and waste material.

Type III    **Black Needlerush Community**

- a. 3-5 tons per acre per annum.
- b. Highly resistant to erosion.
- c. Traps suspended sediments but not as effective as Type II.
- d. Somewhat effective in absorbing flood waters.

Type IV    **Saltbush Community**

- a. 2 tons per acre per annum or less.
- b. Nesting area for small birds and habitat for a variety of wildlife.
- c. Effective trap for flotsam.

Type V    Big Cordgrass Community

- a. 3-6 tons per acre per annum.
- b. Detritus less available than from Type I.
- c. Habitat for small animals and used for muskrat lodges.
- d. Effective erosion buffer.
- e. Flood water assimilation.

Type VI    Cattail Community

- a. 2-4 tons per acre per annum.
- b. Habitat for birds and utilized by muskrats.
- c. Traps upland sediments.

Type VII    Arrow Arum-Pickerel Weed Community

- a. 2-4 tons per acre per annum.
- b. Detritus readily available to marine environment.
- c. Seeds eaten by wood ducks.
- d. Susceptible to erosion from wave action and boat wakes, particularly in winter months.

Type VIII    Reed Grass Community

- a. 4-6 tons per acre per annum.
- b. Little value to wildlife except for cover.
- c. Invades marshes and competes with more desirable species.
- d. Deters erosion on disturbed sites.

Type IX    Yellow Pond Lily Community

- a. Less than 1 ton per acre per annum.
- b. Cover and attachment site for aquatic animals and algae.
- c. Feeding territory for fish.

Type X    **Saltwort Community**

- a. Less than 0.5 tons per acre per annum.
- b. Little value to aquatic or marsh animals.

Type XI    **Freshwater Mixed Community**

- a. 3-5 tons per acre per annum.
- b. High diversity of wildlife.
- c. High diversity of wildlife foods.
- d. Often associated with fish spawning and nursery grounds.
- e. Ranks high as a sediment trap and nursery grounds.

Type XII    **Brackish Water Mixed Community**

- a. 3-4 tons per acre per annum.
- b. Wide variety of wildlife foods and habitat.
- c. Deterrent to shoreline erosion.
- d. Serves as sediment trap and assimilates flood waters.
- e. Known spawning and nursery grounds for fish.

### Evaluation of Wetland Types

(From Guidelines for Activities Affecting Virginia Wetlands)

For management purposes, the twelve types of wetlands identified above are grouped into five classifications based on the estimated total environmental value of an acre of each type.

- Group One:      Saltmarsh Cordgrass (Type I)  
                        Arrow Arum-Pickerel Weed (Type VII)  
                        Freshwater Mixed (Type XI)  
                        Brackish Water Mixed (Type XII)

Group One marshes have the highest values in productivity and wildfowl and wildlife utility and are closely associated with fish spawning and nursery areas. They also have high value as erosion inhibitors, are important to the shellfish industry, and are valued as natural shoreline stabilizers. Group One marshes should be preserved.

- Group Two:      Big Cordgrass (Type V)  
                        Saltmeadow (Type II)  
                        Cattail (Type VI)

Group Two marshes are of only slightly lesser value than Group One marshes. The major difference is that detritus produced in these marshes is less readily available to the marine environment due to higher elevations and consequently less tidal action to flush the detritus into adjacent waterways. Group Two marshes have very high values in protecting water quality and acting as buffers against coastal flooding. These marshes should also be preserved; but if development in wetlands is considered to be justified, it would be better to alter Group Two marshes than Group One marshes.

Group Three:      Yellow Pond Lily (Type IX)  
                          Black Needlerush (Type III)

The two marshes in the Group Three category are quite dissimilar in properties. The yellow pond lily marsh is not a significant contributor to the food web, but it does have high values to wildlife and waterfowl. Black needlerush has little wildlife value, but it ranks high as an erosion flood buffer. Group Three marshes are important, though their total values are less than Group One and Two marshes. If development in wetlands is considered necessary, it would be better to alter Group Three marshes than Groups One or Two.

Group Four:      Saltbush (Type IV)

The saltbush community is valued primarily for the diversity and bird nesting area it adds to the marsh ecosystem. To a lesser extent it acts as an erosion buffer. Group Four marshes should not be unnecessarily disturbed, but it would be better to concentrate necessary development in these marshes rather than disturb any of the marshes in the preceding groups.

Group Five:      Saltwort (Type X)  
                          Reedgrass (Type VIII)

Based on present information, Group Five marshes have few values of any significance. While Group Five marshes should not be unreasonably disturbed, it is preferable to develop in these marshes than in any other types.

## Marsh Plants

Common names and scientific names as found in the data tables of this report.

Alder	<i>Alnus serrulata</i> (Aiton) Willd	Jewelweed	<i>Impatiens capensis</i> Meerb
American Germander	<i>Teucrium canadense</i> L.	Joe-Pye Weed	<i>Eupatorium dubium</i> Willd.
Arrow Arum*	<i>Peltandra virginica</i> (L.) Kunth	Juniper	<i>Juniperus virginiana</i> L.
Arrowhead*	<i>Sagittaria falcata</i> Pursh	Lilaeopsis	<i>Lilaeopsis chinensis</i> (L.) Kuntze
	<i>Sagittaria latifolia</i> Willd.	Lizard's-Tail	<i>Saururus cernuus</i> L.
Beak Rush	<i>Rhynchospora</i> spp.	Marsh Fern	<i>Thelypteris palustris</i> Schott
Bedstraw	<i>Galium tinctorium</i> L.	Marsh Fimbristylis	<i>Fimbristylis spadicea</i> (L.) Vahl.
Beggars Ticks*	<i>Bidens coronata</i> (L.) Britton	Marsh Hibiscus*	<i>Hibiscus moscheutos</i> L.
Big Cordgrass*	<i>Spartina cynosuroides</i> (L.) Roth	Marsh Mallow	<i>Kosteletskya virginica</i> Presl.
Black Gum*	<i>Nyssa sylvatica</i> Marshall	Meadow Rue	<i>Thalictrum polygamum</i> Muhl.
Black Needlerush*	<i>Juncus roemerianus</i> Scheele	Mock Bishop's-Weed	<i>Ptilimnium capillaceum</i> (Michaux) Raf.
Black Willow	<i>Salix nigra</i> Marshall	Nut Sedge	<i>Cyperus</i> spp.
Bladderwort	<i>Utricularia</i> sp.	Orach	<i>Atriplex patula</i> L.
Blue Flag	<i>Iris virginica</i> L.	Panic Grass	<i>Panicum agrostoides</i> Spreng.
Boneset	<i>Eupatorium perfoliatum</i> L.	Olney Threesquare	<i>Scirpus olneyi</i> Gray
Burweed	<i>Sparganium</i> sp.	Pickerelweed	<i>Pontederia cordata</i> L.
Button Bush	<i>Cephalanthus occidentalis</i> L.	Plumegrass	<i>Erianthus giganteus</i> (Walter) Muhl
Cane	<i>Arundinaria gigantea</i> Michaux	Red Maple	<i>Acer rubrum</i> L.
Cardinal Flower	<i>Lobelia cardinalis</i> L.	Rice Cutgrass*	<i>Leersia oryzoides</i> (L.) SW.
Cattails*	<i>Typha augustifolia</i> L.	Royal Fern*	<i>Osmunda regalis</i> L.
	<i>Typha latifolia</i> L.	Sacciolepis	<i>Sacciolepis striata</i> (L.) Nash
Chairmaker's Rush	<i>Scirpus americanus</i> Persoon	Saltbush	Marsh Elder <i>Iva frutescens</i> L.*
Climbing Hempweed	<i>Mikania scandens</i> (L.) Willd.	Saltmarsh Aster	<i>Aster subulatus</i> Michaux
Common Reed*	<i>Phragmites australis</i> (Cav.) Trin. ex Steud.	Saltmarsh Bulrush	<i>Aster tenuifolius</i> L.
Dayflower	<i>Commelina virginica</i> L.	Saltmarsh Cordgrass*	<i>Scirpus robustus</i> Pursh
Dogwood	<i>Cornus amomum</i> Miller	Saltmarsh Loosestrife	<i>Spartina alterniflora</i> Loisel
Eryngo	<i>Eryngium aquaticum</i> L.	Saltmeadow Hay*	<i>Lythrum lineare</i> L.
False Nettle	<i>Boehmeria cylindrica</i> (L.) Swartz	Seaside Goldenrod	<i>Spartina patens</i> (Aiton) Muhl.
Fleabane*	<i>Pluchea purpurascens</i> (Swartz) DC	Sensitive Fern	<i>Solidago sempervirens</i> L.
Foxtail Grass	<i>Setaria magna</i> Grisebach	Slough Grass	<i>Onoclea sensibilis</i> L.
Gerardia	<i>Agalinis purpurea</i> (L.) Pennell	Smartweed*	<i>Spartina pectinata</i> Link
Giant Bulrush*	<i>Scirpus validus</i> Vahl.		<i>Polygonum punctatum</i> Ell.
Ironweed	<i>Vernonia nova boracensis</i> (L.)		

Sneezeweed	<i>Helenium autumnale</i> L.
Soft Rush	<i>Juncus effusus</i> L.
Spikerush	<i>Eleocharis fallax</i> Weatherby
St. John's Wort	<i>Eleocharis parvula</i> (R.+S.) Link
Swamp Loosestrife	<i>Hypericum</i> sp.
Swamp Milkweed	<i>Decodon verticillatus</i> (L.) Ell.
Swamp Rose	<i>Asclepias incarnata</i> L.
Sweet Flag*	<i>Rosa palustris</i> Marshall
Sweet Pepperbush	<i>Acorus calamus</i> L.
Switch Grass*	<i>Clethra alnifolia</i> L.
Tearthumb	<i>Panicum virgatum</i> L.
Three-Way Sedge	<i>Polygonum arifolium</i> L.
Turk's-Cap Lily	<i>Polygonum sagittatum</i> L.
Virginia Willow	<i>Dulichium arundinaceum</i> (L.) Britton
	<i>Lilium michauxii</i> Poiret
	<i>Itea virginica</i> L.

Water Dock*	<i>Rumex verticillatus</i> L.
Water Hemlock	<i>Cicuta maculata</i> L.
Water Hemp*	<i>Amaranthus cannabinus</i> (L.) J.D. Sauer
Water Horehound	<i>Lycopus virginicus</i> L.
Water Lily	<i>Nymphaea odorata</i> Aiton
Water Parsnip	<i>Siim suave</i> Walter
Water Primrose	<i>Ludwigia palustris</i> (L.) Ell.
Water Willow	<i>Justicia americana</i> (L.) Vahl.
Wax Myrtle*	<i>Myrica cerifera</i> L.
Wild Millet	<i>Echinochloa waleri</i> (Pursh) Nash
Wild Rice*	<i>Zizania aquatica</i> L.
Wild Rye	<i>Elymus virginicus</i> L.
Wood Reedgrass	<i>Cinna arundinacea</i> L.
Wool Grass	<i>Scirpus cyperinus</i> (L.) Kunth
Yellow Pond Lily*	<i>Nuphar luteum</i> (L.) Sibth. & Smith

\*Species included in the Wetlands Act of 1972.

## Glossary of Descriptive Terms

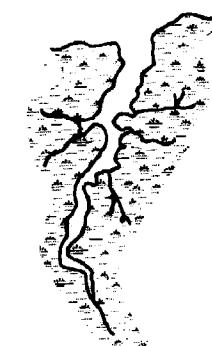

### Cove Marsh

A marsh contained within a concavity or recessed area on a shoreline. The marsh vegetation is usually found surrounding a central, open-water pond, and tidal flushing is permitted through an inlet.

### Creek or Embayed Marsh

A marsh occupying a drowned creek valley. In many large creek marshes the salinity decreases headward; this type of marsh may be divided for inventory purposes into sections if significant changes in the plant community occur along its length.

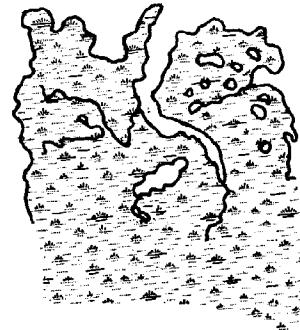

### Delta Marsh

A marsh growing on sediment deposited at the mouth of a tidal creek. Tidal exchange through the creek mouth is usually restricted to narrow channels by the marsh.

Extensive Marsh

A large marsh where the length and depth or width are roughly comparable. Most extensive marshes are drained by many tidal channels and creeks which have little freshwater input.

Fringe Marsh

A marsh which borders a section of shoreline and generally has a much greater length than width or depth.

High Marsh

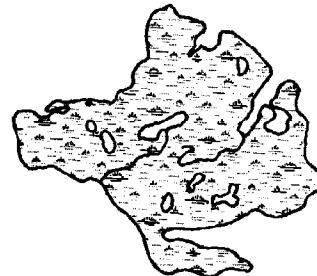

The marsh surface is at an elevation of mean high water or above; it is usually inundated less than twice daily by tidal action.

Low Marsh

The marsh surface is at an elevation below mean high water; it is usually inundated twice daily by tidal action.

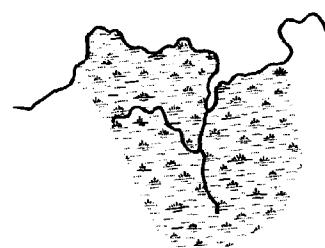

Marsh Island

An isolated marsh surrounded on all sides by open water. Interior portions of the marsh may contain trees scattered at highest elevations.

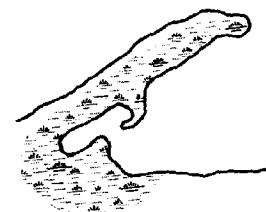

Pocket Marsh

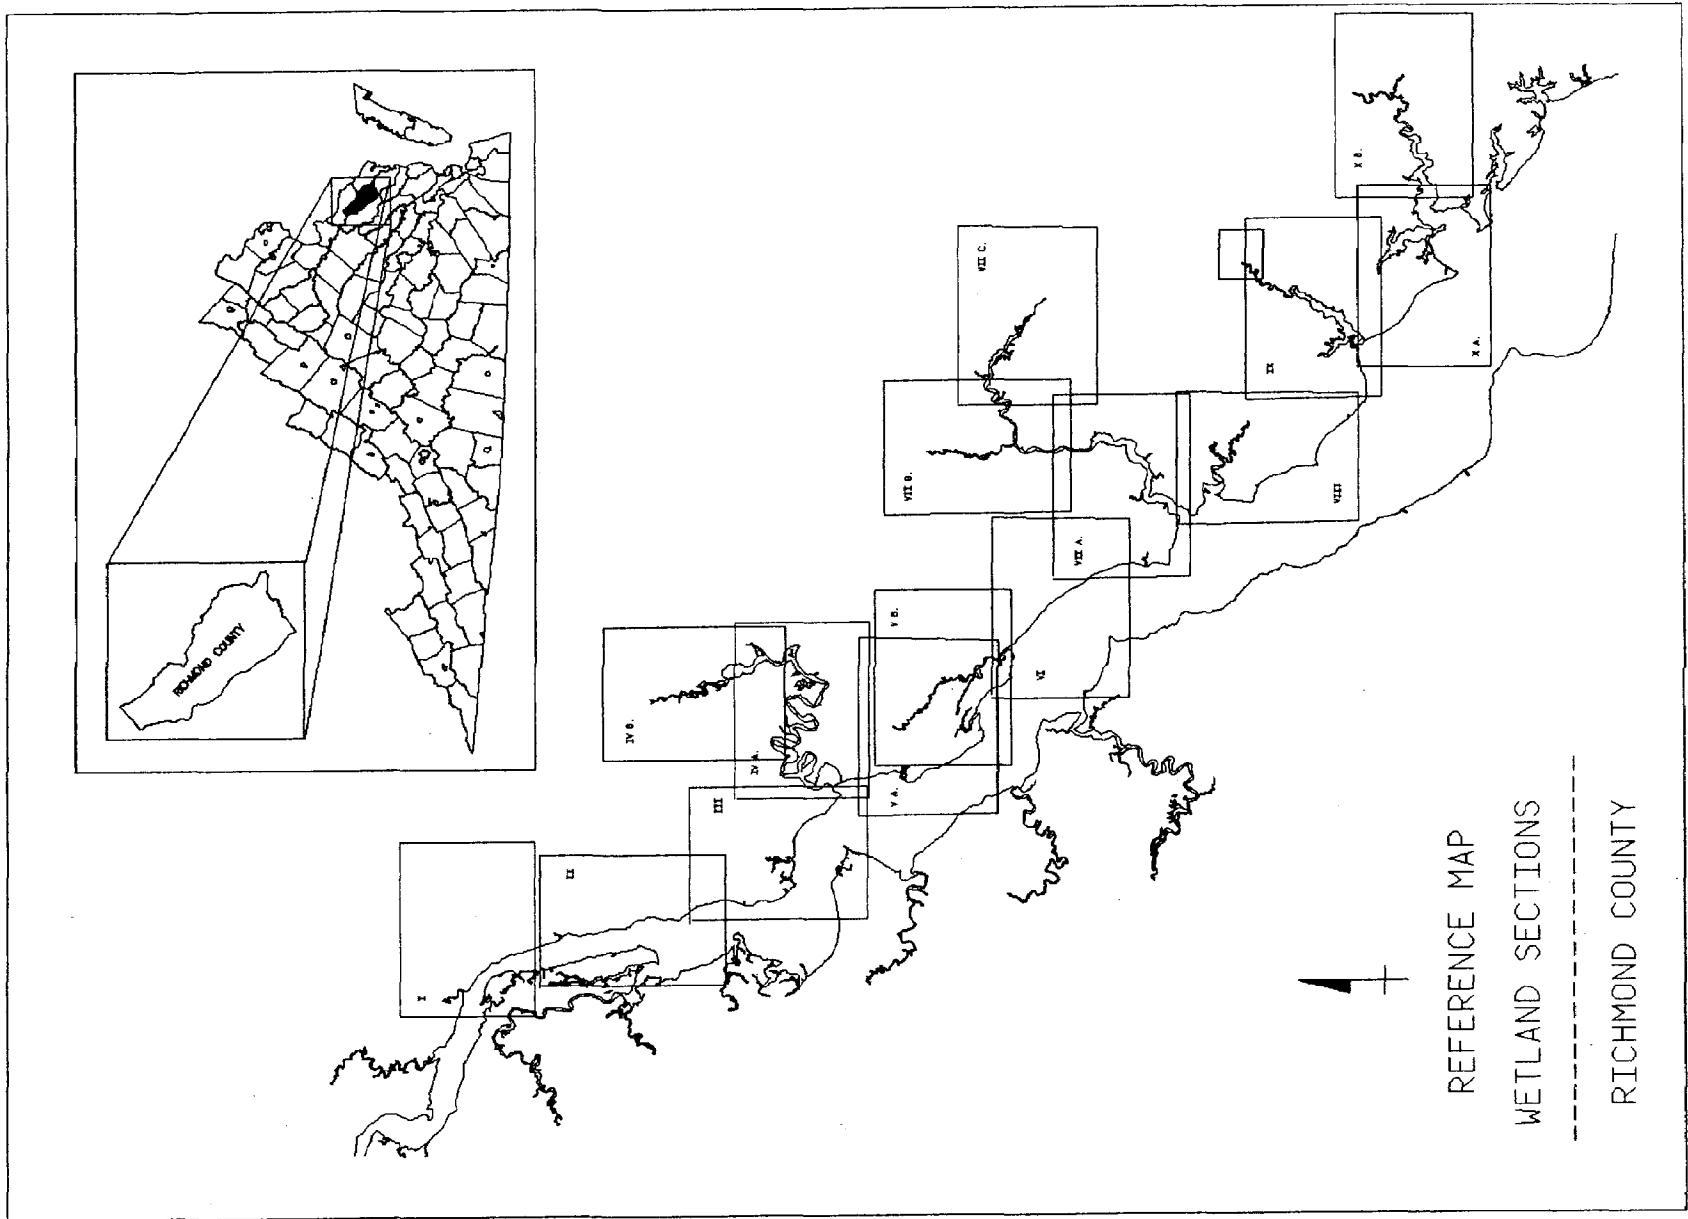

A marsh contained within a small, essentially semi-circular area on a shoreline.

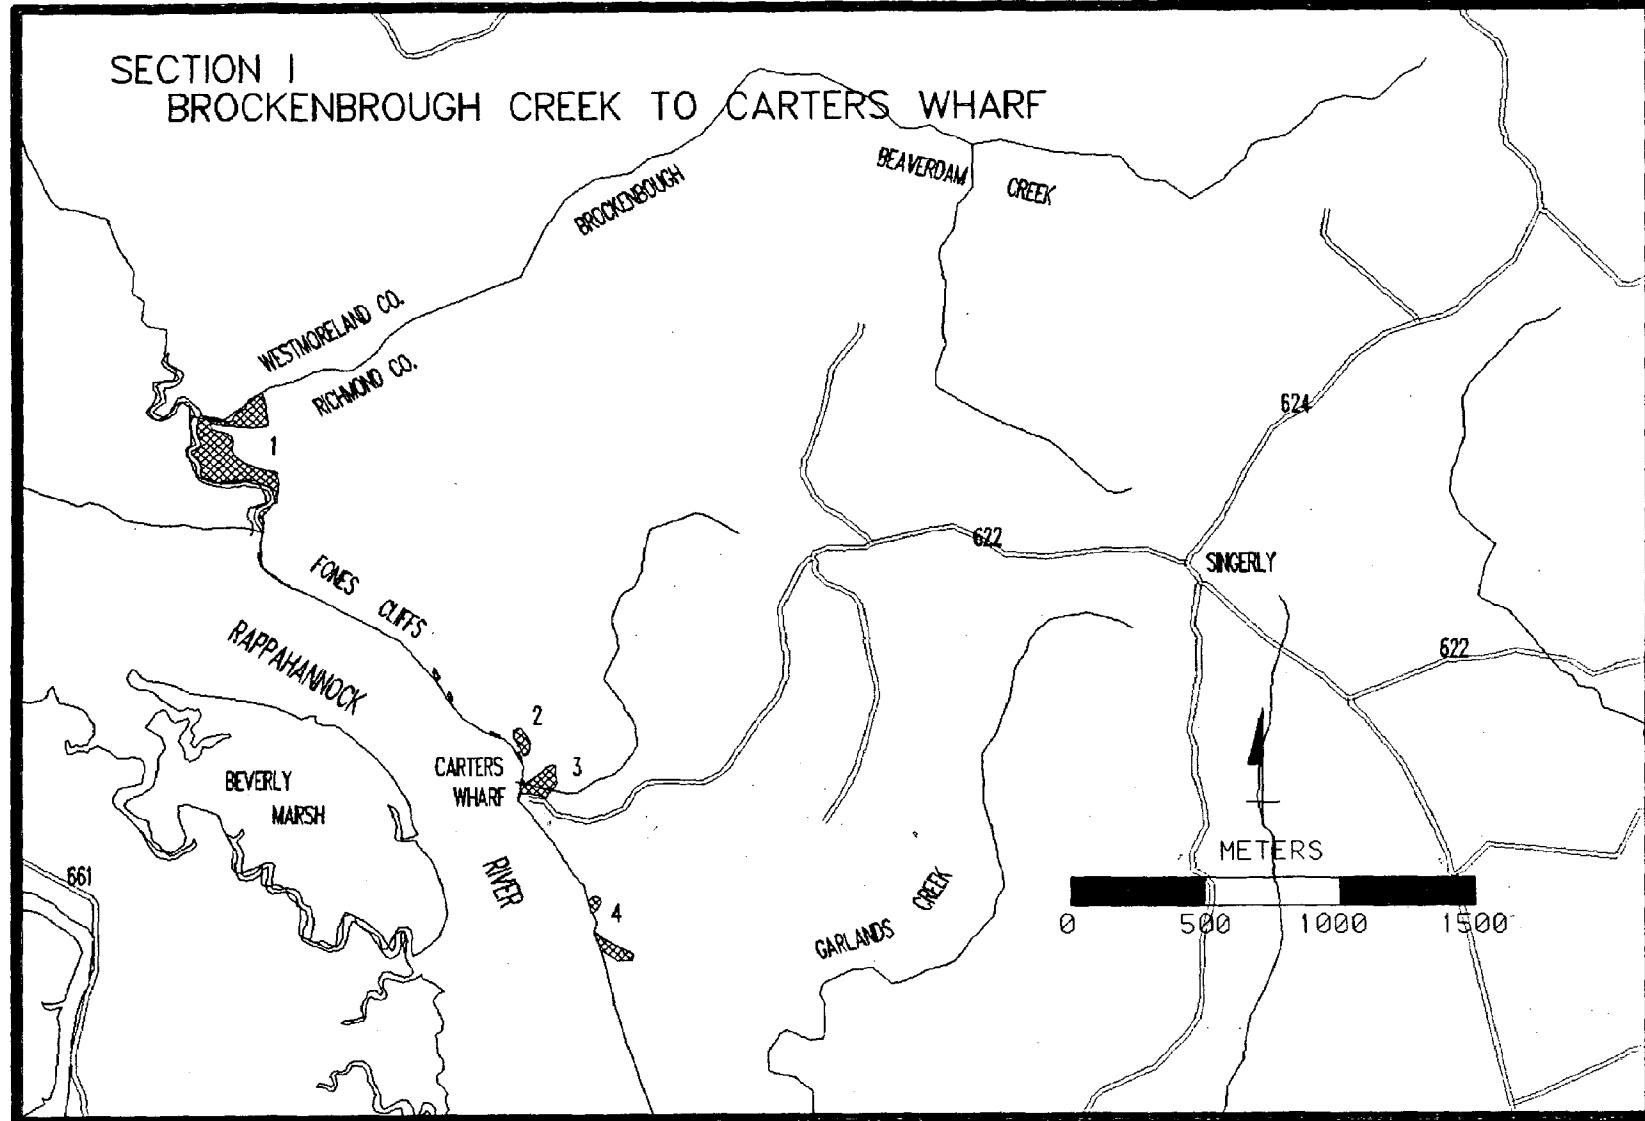

Point or Spit Marsh

A marsh which extends from the uplands in the form of a point or spit. Its development is usually influenced by tidal currents that form a sand berm behind which the marsh forms.
